

7.13.2 Enhancement Notes	Modules Impacted
When selecting an allowance item, a new column has been added to the small modal that appears. This column will show the total amount of pending and projected commitment changes on each allowance item. Note that this value needs to be an absolute value since the allowance change amounts will always be negative on the allowance item.	Cost
In both the Cost and Processes modules, users are now able to change account codes on commitment line items when the commitment is in pending status.	Cost and Processes
When starting a new process or taking action on a process in any step, the validation error message text has been changed to "Incomplete Data. Review all error messages below and enter the mandatory information."	Processes
The width of the Submit button located on the Start Process page has been increased to fit the 15 character limit that is currently allowed.	Processes
In the Processes module, on the Action Properties page, when the action is configured to add a comment, users now have the ability to make comments required. If configured, when a user takes an action that also prompts for a comment, the user will be forced to enter a comment.	Processes
In the Processes module, a new option has been added to the Workflow Properties page that will allow the "Take Action" button to be hidden on the workflow. The action will be submitted by just changing the selection in the action drop-down list.	Processes
In the Processes module, on the spawn step properties (field mappings), there is now an additional check box if both the parent and the spawned process are of the same cost type and all other cost settings for the process match exactly. This check box should be selected if the user wants the spawned process to receive all the cost data (including line items, amounts, funding and custom fields) from the parent cost process. The spawned process will also then be submitted. If the spawned process is set to check for cost controls on the start step, the cost data will be carried forward but the process will not be submitted. This enhancement will apply to all cost types.	Processes
In a process, the step name column in the Attached Documents, Forms and Processes tabs will now show the step sequence number in addition to the step name. When sorting by this column, the step sequence number will be sorted first, and then the name. Also, the Attached Documents, Forms and Processes tab will be added to the Routing History page and for each step. The step name column on the instance details page will be a link that points to the Routing History page for that step and the corresponding tab. Additionally, the date attached column will be modified to include time components as well.	Processes
